

Subalpine Warbler. Spring. Adult. Male (01-VI).

SUBALPINE WARBLER (Sylvia cantillans)

#### **IDENTIFICATION**

12-13 cm. Male with grey head and upperparts; breast orange; iris and eye-ring reddish. Female duller than male, with brownish upperparts; whitish underparts; white eye-ring and grey-brown iris. Wing between 57-64 mm; 10th primary with the same length than primary coverts; both sexes with a white moustache and pale legs.

#### SIMILAR SPECIES

Male recalls a Dartford Warbler which lacks white moustache and has breast with white spots. Female recalls a Spectacled Warbler which has buff wings, lacks pale moustache and grey on head. Juveniles can be more difficult to determine: Spectacled Warbler has greater coverts, tertials and secondaries with broad buff edges; some with wing shorter than 55 mm. Sardinian Warbler has darker upperparts; flanks grey and no buff; fluffy plumage; 10th primary usually longer than primary coverts.

Dartford Warbler

#### Top Spectacled Warbler: left female: right iuvenile: left juvenile Sardinian Warbler.

### SEXING

In spring, male with grey upperparts, red eyering, white moustache, reddish breast; female with duller colours, white eye-ring, pale throat and breast (CAUTION: some 2nd year males are very similar to adult females); juveniles cannot be sexed using plumage characters. In autumn, after postjuvenile moult, a limited sexual dimorphism in 1st year birds can be found: male usually grey with faint orangebrown tinge below; female brown and without orange-brown tinge below (CAUTION: most of the birds are intermediate and sexing only male-like birds are recommended); adults as birds in spring.

#### AGEING

4 types of age can be recognized:

Juvenile with fresh plumage; without moult limit; iris grey-olive.

1st year autumn with moult limit on greater coverts; dark iris.

2nd year spring with moult limit on wing between moulted feathers and juvenile retained, with brown edges; the outermost tail feathers with brownish tinge.

Adult without moult limits on the wing; the outermost tail feathers white; iris reddish.

CAUTION: in spring, after prebreeding moult, both types of age have moult limits; some 2nd year have a complete moult being indistinguishable from adults.

# 367 Subalpine Warbler

#### MOULT

Complete **postbreeding** moult, usually finished in September. Partial **postjuvenile** moult, including lesser and median coverts and most of the greater coverts; some birds can moult all greater coverts, tertials and some flight feathers; usually finished in September. Both types of age have a **prebreeding** moult which can be complete in **juveniles** and most of the wing in **adults**.
